

Provider Requests For a Copy of the Regression Model or LTCFS

Definitions

Regression Model - a copy of the tool showing the member-specific needs and associated acuity values used to build the Residential Care and Supervision rate.

Long-Term Care Functional Screen - a tool used to establish member acuity and functional eligibility for Family Care or other Medicaid long-term care services.

Process

- 1.) Provider fills out the regression model/LTCFS request form and submits the form and additional documents (based on request) to residentialreview@communitycarecw.org.
- 2.) IDT staff is notified of the request by Community First Living Options Coordinator (CFLO).
- 3.) Regression model tool is completed by CFLO Coordinator and is e-mailed “secure” to the provider.
- 4.) If a provider requests a copy of the LTCFS (needs to include form and Release of Information (ROI)):
 - a. IDT is notified of the request.
 - b. The request is forwarded to the Quality Management mailbox (with ROI) by the CFLO Coordinator.
 - c. Screen Supervisor finds the updated screen and forwards the LTCFS to provider via “secure” e-mail.

** If a request is submitted without the appropriate documents identified on the form, a request rejection e-mail will be sent back to the provider noticing insufficient information.
